

Interval Estimation

1. Select the true statement.

- Confidence intervals are always symmetric around the sample mean.
 - A typical confidence interval is one that will contain the sample mean 95% of the time.
 - We always prefer interval estimates in statistics.
 - A confidence interval of the population mean will help us check how accurately the sample average estimates the population mean.
-

2. Which of the following statements about confidence intervals is correct?

- If we move from a 95% confidence interval to a 90% confidence interval, the width of the interval becomes smaller.
 - We interpret a 95% confidence interval as follows: 95% of the time, the sample mean will lie within this interval.
 - Larger n and smaller σ increase accuracy so the confidence interval becomes larger.
 - The critical value used for a 95% confidence interval is the value corresponding to an upper tail probability of 0.05.
-

3. Match the following critical values with the corresponding number using the t-table below.

(2.704, 1.729, 2.262, 2.093)

- Critical value for 95% confidence interval with $n=20 \rightarrow$ _____
- Critical value for 90% confidence interval with $n=20 \rightarrow$ _____
- Critical value for 95% confidence interval with $n=10 \rightarrow$ _____
- Critical value for 99% confidence interval with $n=40 \rightarrow$ _____

	Confidence Level										

4. In a sample of 100 students, 60 report watching TV for at least two hours every day. Which of the following is the 95% confidence interval of the population proportion of students who watch less than two hours of television every day?
- (0.3, 0.5)
 - (0.5, 0.7)
 - Not enough information as we don't know the standard error.
 - Can't compute the confidence interval as the condition required to use the normal approximation to the Binomial is not satisfied.
